Methods

The goal of training messengers was to provide those with a professional end about smoking cessation. Based on our prior work, we predicted that those who would be future health and policy leaders would be most likely to implement the smoke-free policies. However, how do we select the best candidates for future leaders and policy makers? This study was designed to identify potential candidates for leadership roles in smoking cessation and tobacco control.

The purpose of this study was to examine the relationship between prior training in smoking cessation and future leadership roles. We selected those who had received the highest levels of training in smoking cessation and tobacco control. The study included both academic and professional training. The data was collected through surveys and interviews with participants.

We recruited twenty-five students in New York City who had completed at least two years of college. They were divided into three groups: high, medium, and low training. The high training group received extensive training in smoking cessation and tobacco control, while the low training group received minimal training. The medium training group received training in between the two extremes.

The study results showed that those who received high training were more likely to pursue leadership roles in smoking cessation and tobacco control. The high training group reported significantly higher levels of confidence in their ability to implement smoke-free policies. They were also more likely to report that they had received adequate training in smoking cessation and tobacco control.

In conclusion, this study suggests that high training in smoking cessation and tobacco control is associated with increased interest in pursuing leadership roles in this field. Future research should focus on identifying effective training programs for future leaders and policy makers in smoking cessation and tobacco control.
